Serial numbers

Engine serial number Vetus: .................................................................

Mitsubishi: ...........................................................................................

Gearbox serial number: ....................................................................... 340402.01

Please enter the serial numbers here.
These numbers should be quoted when inquiring about Customer Service, Repairs or Spare Parts (see page 6).

We reserve the right to make any changes without previous notice.

Copyright © 2009 Vetus N.V. Schiedam Holland
Please read and observe the information given in this operation manual. This will enable you to avoid accidents, preserve the manufacturer’s warranty and maintain the engine in peak operating condition.

For the Guarantee Conditions, see the Vetus Diesel 'Service and Warrantee Manual' (320199.05).

This engine has been built exclusively for the application specified in the scope of supply and is to be used only for the intended purpose. Any use exceeding that scope is considered to be contrary to the intended purpose. The manufacturer will not assume responsibility for any damage resulting therefrom. The risks involved are to be borne by the user.

Use in accordance with the intended purpose also implies compliance with the conditions laid down by the manufacturer for operation, maintenance and servicing. The engine should only be operated, maintained and serviced by persons which are familiar with the former and the hazards involved.

The relevant accident prevention guidelines and other generally accepted safety and industrial hygiene regulations must be observed.

Unauthorized engine modifications will invalidate any liability claims against the manufacturer for resultant damage.

Manipulations of the injection and regulating system may also influence the performance of the engine, and its emissions. Adherence to legislation on pollution cannot be guaranteed under such conditions.
1 Safety measures

Warning indications
The following warning indications are used in this manual in the context of safety:

⚠️ **DANGER**
Indicates that great potential danger exists that can lead to serious injury or death.

⚠️ **CAUTION**
Indicates that the usage procedures, actions etc. concerned can result in serious damage to or destruction of the engine. Some CAUTION indications also advise that a potential danger exists that can lead to serious injury or death.

⚠️ **WARNING**
Indicates that a potential danger that can lead to injury exists.

⚠️ **NOTE**
Emphasises important procedures, circumstances etc.

**Symbols**
- ✔️ Indicates that the relevant procedure must be carried out.
- ✗ Indicates that a particular action is forbidden.

Pass the safety precautions on to other people who will use the engine.

General rules and laws concerning safety and accident prevention must always be observed.
1 Safety measures

Fire risk!

- Do not smoke if refuelling.
- Avoid spilling fuel on hot surfaces. Spilled fuel must be cleaned up immediately.
- Do not use petrol or diesel to clean components but make use of good quality, non-inflammable, non-poisonous solvents that are available from dealers.
- Always be alert to possible fuel or oil leakage! If you discover a leak, take countermeasures immediately. If fuel or oil is spilled on a hot engine, fire can break out. This can cause physical injury or damage to the equipment.

- Do not fill the fuel tank while the engine is running! Only refuel with the engine stopped.
- Never put flammable materials in the vicinity of the engine!
- Keep the engine and engine compartment clean! Remove all inflammable materials such as fuel, oil and other litter before it builds up in the vicinity of the engine.
- Connecting (emergency) extra starting battery
  Proceed as follows when an extra starting battery is used to jump start the engine:
  - First connect the positive lead
  - Lastly connect the earth cable (negative pole) to the engine block
  If this cable is connected in error to the negative pole of the engine battery, a spark can occur. The result of this could be that explosive gas produced by the battery explodes.
  - Once the engine is started, first remove the earth cable.
1 Safety measures

• The moving parts of the engine are dangerous. Never touch moving parts of the engine while it is running, to prevent cuts and other injuries.

• Stop the engine before carrying out maintenance!

• Always stop the engine before topping up or replacing fuel, oil or coolant.

• Before carrying out inspection or maintenance, the ignition key must be removed and the main battery switch turned off.

• Satisfy yourself that everything is in order before the engine is started again! Make sure that no-one is working on or close to the engine before you start it. Remove all foreign objects from around the engine, such as litter, oil, tools and other components that are not part of the engine.

• Install all protective covers! To prevent injury, make sure that all protective covers and cover plates are replaced over moving parts.

• Remove any tool used to turn the engine over. If you leave this in position, serious injury or damage to the equipment can result.

• NEVER open the cap of the expansion tank when the engine is at working temperature.

• Only check the coolant level after the engine has been stopped and the filler cap on the heat exchanger is cool enough to be removed with bare hands.

• Never attempt to adjust the fan belt on a running engine.
1 Safety measures

- Be careful with battery acid!
  If battery acid comes in contact with the eyes or skin, rinse the affected part immediately with copious amounts of water. If battery acid comes in contact with the eyes, rinse them out immediately with plenty of water and consult a doctor.

- Be careful with antifreeze!
  If you accidentally swallow antifreeze, make yourself vomit and consult a doctor immediately. If antifreeze comes in contact with your eyes, wash them out immediately with plenty of water and consult a doctor.

- Make sure that you are wearing suitable clothing before starting work!
  For your own safety you will most likely need special equipment – safety helmet, eye protection, safety boots, safety goggles, heavy gloves, ear protectors etc. Use them when necessary.

- Carry out maintenance procedures safely by only using suitable tools.

- Exhaust gases
  Do not start the engine if the exhaust system is not connected.
1 Safety measures

• When the engine stops suddenly:
  If the engine stops suddenly, do not start it again immediately. Track down the cause and carry out the necessary repairs before you start the engine again. If you do not do this, serious engine problems can develop.

• If the oil pressure is too low:
  Stop the engine immediately and check the lubrication system. Running an engine with low oil pressure can cause bearing and other parts to seize.

• If the engine overheats:
  If the engine should overheat, do not switch it off immediately. If an overheated engine is stopped suddenly, this can cause the coolant temperature to rise rapidly and moving parts to seize. First let the engine run in neutral to allow the hot parts of the engine to cool down, stop the engine and allow it to cool, and then gradually top up the coolant. Remember: adding coolant to an overheated engine can cause damage to the cylinder head.

• If the fan belt is broken:
  Immediately stop the engine. If an engine is used with a broken fan belt, this can lead to the engine overheating, which in turn can cause coolant to spray out of the expansion tank.

When problems occur
2 Introduction

Dear customer,

Vetus diesel engines are designed both for pleasure and commercial craft. Consequently, a wide range of variants are offered to meet the requirements of specific cases.

Your engine is appropriately equipped for your vessel, which means that not necessarily all components described in this manual are mounted to your engine.

We have endeavoured to highlight any differences so that you will be able to locate the operating and maintenance instructions relevant to your engine quickly and easily.

Please read this manual before starting your engine and always observe the operating and maintenance instructions.

We are available to help with any additional inquiries.

Sincerely,
Vetus n.v. 
2 Introduction

1 Engine data tag

The Vetus engine serial number and performance data are printed on the engine data tag.

Model and engine serial number must be given when ordering spare parts.

2 Engine data tag location

The Vetus engine data tag is attached to the valve cover.

3 Engine serial number

The Mitsubishi engine serial number is stamped on the fuel injection pump. (arrow)
4 Cylinder numbering

Cylinders are numbered consecutively, beginning at the front end.

5 Fuel pump seal

Breaking the seals and altering the settings can lead to:
- Accelerated wear of engine components.
- Increased fuel and oil consumption.
- Incorrectly adjusted injector volume and poor engine performance.
- Breaking emission regulations.

CAUTION

Breaking the seals on the regulator to alter the settings of maximum rpm and maximum injector volume may only be carried out by authorised Vetus Service personnel.
2 Introduction

1 Oil filler cap
2 8 mm fuel hose connection
3 Fuel pump
4 Oil filter

2 Introduction

Control panels, engines with intercooling

Basic panel (model 22)
Fly-bridge panel (excl. voltmeter, model 21)

1 Tachometer/Operating hours counter
2 Voltmeter
3 Starter pre-heat switch/lock
4 Warning light high raw water temperature
5 Warning light low oil pressure
6 Warning light high coolant temperature

5 37 864 9

VD00576

Sailingboat panel (model 10)

7 Warning light battery charging
8 Indicator light pre-heating
9 Warning light gearbox low oil pressure *

*) This is an option, not fitted as standard.
2 Introduction

Basic panel (model 22)
Fly-bridge panel (excl. voltmeter, model 21)

1 Tachometer/Operating hours counter
2 Voltmeter
3 Starter pre-heat switch/lock
4 Warning light battery charging second alternator
5 Warning light low oil pressure
6 Warning light high coolant temperature
7 Warning light battery charging
8 Indicator light pre-heating
9 Warning light gearbox low oil pressure *

*) This is an option, not fitted as standard.
Extended panel (model 34)

1. Tachometer/Operating hours counter
2. Voltmeter
3. Starter pre-heat switch/lock
4. Warning light high raw water temperature
5. Warning light low oil pressure
6. Warning light high coolant temperature
7. Warning light battery charging
8. Indicator light pre-heating
9. Warning light gearbox low oil pressure *
10. Temperature gauge, coolant
11. Oil pressure gauge

*) This is an option, not fitted as standard.
Implementing the following recommendations will result in longer life and better performance and more economical operation of your engine.

- Carry out the maintenance described regularly, including the 'Daily procedures before starting'.
- Use anti-freeze in the engine coolant all year long, this helps prevent corrosion as well as protecting against frost damage. For specifications see page 87.
- Never run the engine without a thermostat.
- Use a good quality lubricating oil. For specifications see page 84.
- Use a good quality diesel fuel that is free of water and other pollutants.
- Always stop the engine immediately if one of the warning lamps for oil pressure, high coolant temperature, high raw water temperature ¹ or battery charging lights up.
- Always follow the safety advice, see page 4.

¹ Only engines with intercooling.
3 Use

1 Commissioning the engine

Before starting the engine for the first time, the following procedures must be carried out:

2 Filling with engine oil

As a rule engines are delivered empty of oil.
Fill the engine with oil through the filler neck on top of the valve cover, for quantity and specification see page 65.

Check the oil level with the dipstick, see page 32.

A second oil filling cap is located at the distribution cover.

Engine Oil

5.5 litres 15 W40
(1 gal - 1.7 pt, UK)
(1 gal - 3.6 pt, US)

API: CF, CF-4, CI-4

For example:
Vetus Marine Diesel Engine Oil
Shell Nautilus Premium Inboard 15W-40

First commissioning
3 Use

Vetus engines are normally equipped with Technodrive or ZF-Hurth gearboxes.

In case your engine is equipped with another brand of gearbox follow the instructions given in the supplied owners manual.

3 Filling gearbox with oil

Fill the gearbox with oil.

Check the oil level with the dipstick, see page 42.

Technodrive:
- type TM345 : 1,6 litres, Engine oil SAE 20W40-CD
- type TM345A : 1,6 litres, Engine oil SAE 20W40-CD (2.8 UK pt, 3.4 US pt)
- type TMC60 : 0,8 litre, Engine oil SAE 20/30 (1.4 UK pt, 1.7 US pt)
- type TMC60E : 0.8 litres ATF*)
- type TMC60M : 0.8 litres ATF*)

ZF Hurth:
- type ZF25 : 2,5 litres ATF*) (4.4 UK pt, 5.3 US pt)
- type ZF25A : 1,8 litres ATF *) (3.2 UK pt, 3.8 US pt)

*) ATF: Automatic Transmission Fluid type A, Suffix A.
3 Use

4 Filling the cooling system

Remove the cap of the filler neck on the top of the heat exchanger housing.
Remove the bolt from the upper side of the thermostat cover, so that air can escape from the cooling system.
Fill the cooling system.
Use a mixture of 40% antifreeze (ethylene-glycol based) and 60% tap water or use a special coolant.

For specifications see page 87.

The level of the coolant must be approx. 1 cm (3/8") below the lower edge of the filler neck.
Bleeding will take place automatically during filling!
Replace the filler cap.
After the engine has run for the first time and has reached operating temperature and has cooled down again to ambient temperature, check the coolant level in the heat exchanger housing.

If necessary, add coolant.

Note

Water heater

If a water heater is connected to the engine and this heater is positioned above the upper side of the engine then bleeding of the heater will not take place automatically!
Follow filling instructions on p. 57.

Caution

Never fill the cooling system with sea water or brackish water.

Coolant quantity: 6.5 litres
(1 gal - 3.4 pt UK) (1 gal - 5.7 pt US)

Use

First commissioning

3 Use

4 Filling the cooling system

Remove the cap of the filler neck on the top of the heat exchanger housing.
Remove the bolt from the upper side of the thermostat cover, so that air can escape from the cooling system.
Fill the cooling system.
Use a mixture of 40% antifreeze (ethylene-glycol based) and 60% tap water or use a special coolant.

For specifications see page 87.

The level of the coolant must be approx. 1 cm (3/8") below the lower edge of the filler neck.
Bleeding will take place automatically during filling!
Replace the filler cap.
After the engine has run for the first time and has reached operating temperature and has cooled down again to ambient temperature, check the coolant level in the heat exchanger housing.

If necessary, add coolant.

Note

Water heater

If a water heater is connected to the engine and this heater is positioned above the upper side of the engine then bleeding of the heater will not take place automatically!
Follow filling instructions on p. 57.

Caution

Never fill the cooling system with sea water or brackish water.

Coolant quantity: 6.5 litres
(1 gal - 3.4 pt UK) (1 gal - 5.7 pt US)
5 Fuel

Ensure that the fuel tank is filled with diesel fuel.
Use only clean, water-free, commercial approved diesel fuel.
For fuel grade see page 83.
Bleed the fuel system, see page 36.

6 Other preparations

- Check battery and cable connections.
- Start the engine, see page 22, and let it run for about 10 minutes without load.
Check the engine and all connections (fuel, cooling water and exhaust) for leaks.

7 Running-in

In order to ensure a long life for your engine, please observe the following for the first 50 operating hours:

- Allow the engine to reach operating temperature before applying a load.
- Avoid fast acceleration.
- Do not allow the engine to run faster than 3/4 of maximum RPM.

First commissioning
Running-in

3 Use

WARNING

Never fill the fuel tank while the engine is running. Do not spill fuel. Prevent unnecessary pollution.
3 Use

Before starting, **ALWAYS** check the following points:

- Engine oil level.
- Coolant level.
- Sea cock open.
- Main switch ‘**on**’.
- Gearbox in ‘**neutral**’ position.

**After repair work:**

Check that all guards have been replaced and that all tools have been removed from the engine.

When starting with pre-heating, do not use any other substance (e.g. injection with ‘Easy Start’). Doing so could result in an accident.

8 Preparation starting

Before starting the engine, always check that the control lever(s) is (are) in the neutral position.

9 Control lever

Set the control lever to ‘half throttle’ **without** engaging the gearbox.

**WARNING**

*Never start the engine with the fuel injection pump removed.*

*Disconnect battery.*
3 Use

Turn the start key on the instrument panel clock-wise; the warning lights for oil pressure and alternator will now light up and the alarm buzzer will sound.

10 Pre-heating

Turn the key further clockwise to the ‘ ⍺’ position; only the pre-heating indicator light will be lit now.

Hold the key in this position for about 6 seconds.

11 Pre-heating time

The ideal pre-heating time depends on ambient temperature; the lower the ambient temperature, the longer the pre-heating time required. See table.

Caution

To prevent the glow plugs from burning out, never exceed the stated maximum pre-heating time.
3 Use

12 Starting

Now turn the key further to the ‘START’ position.

Release the key as soon as the engine fires (the key will return to the ‘ON’ position) and throttle back. Leave the key in this position while the engine is running.

Caution

Release the key if the engine does not fire within 10 seconds.

Let the starter motor cool for 30 seconds before turning the key to the ‘START’ position again.
Check that the indicator lights for oil pressure and alternator are off.

Cooling water should now flow out of the exhaust; if this is not the case, stop the engine immediately¹.

Let the engine run for 5 to 10 minutes in neutral. A good warm up is essential to ensure maximum lifetime and good performance.

**NEVER** turn the main switch off while the engine is running.

---

¹ Only engines with intercooling.
The instrument panel is provided with the following instruments (Depending of the type of panel, see page 14).

13 Tachometer

Indicating the number of revolutions per minute of the engine.

Also the number of running hours is indicated.

Idling speed : 900 rpm

⚠️ WARNING

Avoid idling for more than 10 minutes.

This can lead to carbon deposits in the combustion chambers and incomplete combustion of fuel.
3 Use

14 Voltmeter

Indicating the battery voltage. When the engine is running, the battery voltage should be between 12 and 14 Volts.

With the engine stopped and the start key in the first position, the voltmeter should indicate 12 Volts.

15 Warning lights

None of the five warning lights should light up while the engine is running.

16 Alarm buzzer

Oil pressure, battery charging and temperature indicator lights are all connected to an alarm buzzer. If this alarm buzzer sounds while running, STOP THE ENGINE IMMEDIATELY!
3 Use

17 Electrical shutdown

Reduce engine speed to idle and shift the gearbox to ‘NEUTRAL’. Turn the key entirely to the left, through the ‘OFF’ position.

Never stop the engine immediately after it has been in operation for a long time. Allow the engine to idle for a few minutes before stopping.

18 Mechanical shutdown

When the engine has stopped, turn the key to the ‘OFF’ position.

If the engine is not to be used for some time, it is recommended that the sea cock is closed and the battery main switch turned off.

On the engine itself stopping is possible by pressing the black button on the fuel injection pump. If the fuel supply is not shut off by the electrically operated fuel solenoid stopping of the engine can be done this way.
4 Maintenance

Introduction

The following guidelines should be observed for daily and periodic maintenance. Perform each function at the indicated time interval.

The intervals stated are for normal operational conditions. Service the unit more frequently under severe conditions.

Failure to carry out maintenance can result in faults and permanent damage to the engine.

No claim can be made on the Guarantee if maintenance has been neglected.

Keep record of the following information in the logbook and/or the ‘Service and Guarantee Book’:

- Total engine hours (reading engine hour counter).
- Amounts of oil, fuel and coolant needed for topping up.
- The dates and intervals at which the oil and coolant are changed.
- Oil pressure and coolant temperature.
- Parts on which maintenance is conducted and type of maintenance (adjustment, repair or replacement), and the results of each procedure.
- Changes in operating conditions, such as ‘Exhaust gas became black’, etc.
4 Maintenance

Every 10 hours or daily, before starting
- Check engine oil level 32
- Check coolant level 33
- Check water strainer 34

After the first 50 hours
- Drain water from fuel filter 35
- Engine oil change 37
- Replace oil filter 38
- Change gearbox oil (Technodrive) 43
- Change gearbox oil and replace filter (ZF Hurth) 44
- Replace fuel filter 48
- Check idle rpm 59

Danger
Stop the engine before carrying out any maintenance work.

Every 100 hours, at least once every year
- Drain water from fuel filter 35
- Engine oil change 37
- Replace oil filter 38
- Battery, cables and cable connections 40
- Check gearbox oil level 42

Every 500 hours, at least once every year
- Change gearbox oil (Technodrive) 43
- Change gearbox oil and replace filter (ZF Hurth) 44
- Check valve clearance 46
- Replace fuel filter 48
- Cleaning fuel lift pump 49
- Check V-belt 50
- Check flexible engine mounts 51
- Check engine for leaks 51
- Check tightness of all fasteners, bolts and nuts 51
## 4 Maintenance

* Consult the service manual, work to be carried out by a Vetus Mitsubishi dealer.

**) Only engines with intercooling!

---

**DANGER**

Stop the engine before carrying out any maintenance work.
4 Maintenance

1 Check oil level

Turn the engine off. The dipstick is located on the starboard side of the engine.

2 Oil level

The oil level must be at or near the upper mark on the dipstick*. If necessary top up with the same brand and type of oil.

*) The difference between the two oil level marks is:
1.9 litres (3.3 UK pt, 4 US pt)

3 Topping up oil

The oil filling cap is on top of the the valve cover.

A second oil filling cap is located at the distribution cover, see page 18.

Checking engine oil level

Daily, before starting.
4 Checking coolant level

Check the coolant level in the header tank. This has to be checked when the engine is cold.
Remove the cap of the filler neck on the heat exchanger.

The level of the coolant must be approx. 1 cm (3/8”) below the lower edge of the filler neck.

If necessary, top up. When topping up coolant, remove the bolt from the upper side of the thermostat cover, so that air can escape from the cooling system.

⚠️ WARNING
Never open the cap on the header tank when the engine is at operating temperature.

5 Topping up coolant

The internal cooling system can be filled with a mixture of anti-freeze (40 %) and tap water (60 %) or with a special coolant. For specification, see page 87.

⚠️ CAUTION
Never fill the cooling system with sea water or brackish water.
4 Maintenance

6 Checking the raw water strainer
Check daily whether there is any dirt in the raw water strainer.

7 Cleaning the strainer
Close the seacock before removing the lid of the water strainer.
Clean the raw water strainer as often as is necessary, depending on the pollution of the waterways, but at least once every 6 months. A clogged raw water strainer will result in excessive temperatures or overheating of the engine coolant.

Check the sealing between the lid and housing after cleaning and re-assembling the strainer. An improperly sealed lid will result in air sucked in by the sea water pump which again will result in overheating of the engine.

NOTE
Only engines with intercooling!
4 Maintenance

8 Empty fuel filter

- Open the drain plug at the lower side of the filter.
- Drain the water and close the drain plug.

9 Empty water separator

Empty the separately installed water separator/fuel filter:
- Open the drain plug at the lower side of the filter.
- Drain the water and close the drain plug.

Note: The water separator is not within the scope of supply but installation is required!

DANGER

Do not smoke when draining off water and sediment. Keep flame and sources of ignition out of the area. Remove spilled fuel and litter before you start the engine.
4 Maintenance

10 Bleeding

After the water separator/fuel filter has been drained, the air has to be bled from the fuel system.

The fuel system is self-bleeding.

Turn the key of the starter switch to position 'ON' and the fuel lift pump will feed the fuel system.

Open the bleeding nipple to speed up the bleeding process.

Close the bleeding nipple when all air has escaped.

11 Start the engine

Operate the starter switch until the engine fires; release the starter switch if the engine does not fire within 20 seconds. Wait until the starter motor has stopped before making a new attempt to start the engine.

Repeat the above if the engine cuts out after a short time.

Draining of water from the water separator/fuel filter

Every 100 operating hours.
4 Maintenance

12 Engine oil change

Change the engine oil every 100 hours of operation (together with engine oil filter replacement).

If the engine runs less than 100 hours during the year the oil should be changed at least once a year.

Run the engine for a few minutes before changing the oil; warm oil can be pumped out more easily.

Change the oil with a switched off engine at operation temperature. (Lube oil temperature max. 80°C (176°F).)

⚠️ Danger

Be aware of the risk of skin burning during draining the hot oil! Used oil must be collected in a container for proper disposal according to laws and regulations.

13 Draining the oil

Remove the dipstick; insert the suction hose of the supplied sump pump in the dipstick tube.

Push down the pump handle quickly and pull it up slowly.
4 Maintenance

14 Removing the oil filter

Unscrew the oil filter, with a commercially available tool, when all the oil has been pumped out.
Catch any dripping oil.

15 Oiling the oil seal

Clean the contact surface of the gasket.
Lubricate the oil seal of the new filter element with clean engine oil.

16 Oil filter installation

Install the filter in accordance with the instructions printed on the filter element housing.

⚠️ DANGER

Beware of burns from hot oil.
4 Maintenance

**Engine oil change**
Every 100 operating hours.

**AMOUNT OF OIL:** 6.0 litres (OIL FILTER INCL.)
(1 gal - 2.6 pt UK) (1 gal - 4.7pt US)

17 Refilling with oil

Refill the engine with new oil (for specification see page 84) through the filler opening in the valve cover.
Operate the engine at idling speed for a short period of time. Check for oil leaks whilst the engine is running.
Stop the engine. Allow 5 minutes for the oil to return to the sump. Check the oil level with the dipstick.
4 Maintenance

18 Battery, battery connections

Keep battery clean and dry.
Remove battery cables (negative first).
Clean battery posts (+ and -) and clamps and grease with acid-free and acid-resistant grease.
Ensure that clamps make good contact after reassembling. Hand tighten the bolts only.

19 Checking specific gravity

Every Vetus Maintenance-free battery has a hydrometer (1) built into the cover. Visual inspection of the hydrometer will show one of three conditions:

20 Hydrometer operation

- **Green dot visible** - State of charge 65 % or more.
- **Dark** - State of charge less than 65 %.
  Recharge immediately.
- **Clear or light yellow** - Electrolyte level low.
  In case of low level, caused by overcharging the battery for a long period of time with a voltage too high, replace battery. Check alternator and/or voltage regulator.
21 Checking electrolyte level

For conventional batteries it is required to check the electrolyte level regularly. Remove vent caps (taking care no spark or open flame is nearby) and inspect the level. Fluid should be 10 to 15 mm (3/8" to 5/8") above top of all plates. If necessary top up with distilled water. Replace vent caps and charge the battery for 15 minutes at 15 - 25 Amps to mix electrolyte.

22 Checking specific gravity

Measure the electrolyte specific gravity of the individual cells with a commercial hydrometer. The hydrometer reading (see table) indicates the state of charge. Hydrometer reading of all cells should be at least 1.200 and show less than 0.050 between high and low. If not, recharge or replace battery. During checking the temperature of the electrolyte should preferably be 20°C (68°F).

> **DANGER**

The gases emitted by the battery are explosive! Keep sparks and naked flames away from the battery!

Do not allow battery acid to come into contact with skin or clothing!

Wear protective goggles!

Do not rest tools on the battery!

### Battery, cables and connections

Every 100 operating hours.

<table>
<thead>
<tr>
<th>Specific gravity</th>
<th>State of charge</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.280</td>
<td>100%</td>

4 Maintenance

Vetus engines are normally equipped with Technodrive or ZF-Hurth gearboxes. Consult the supplied Owners Manual for more details about care and maintenance. In case your engine is equipped with another brand of gearbox follow the instructions given in the supplied owners manual for changing oil and other care and maintenance.

23 Oil level check (Technodrive)

The oil level must between the two marks on the dipstick
If necessary top up.
The fillercap is on top of the gearbox housing. For oil type and specification see page 86.

24 Oil level check (ZF-Hurth)

Unscrew the dipstick out of the gearbox housing.

Check the oil level by cleaning the dipstick and lowering it into the hole, without screwing it in. The oil level must between the two marks on the dipstick
If necessary top up by pouring oil in the dipstick hole. For oil type and specification see page 86.
4 Maintenance

25 Draining the oil

Remove the drain plug to drain the oil.

Remove the fillercap to vent the gearbox and check if all oil has been drained.

Collect the oil in a dripping pan.

26 Filling with new oil

Refill the gearbox to the correct level via the filling hole.

For oil specification see page 86.

In case your engine is equipped with another brand of gearbox follow the instructions given in the supplied owners manual for changing oil and other care and maintenance.
4 Maintenance

27 Draining the oil

Drain the oil with the aid of a separate sump pump.

Insert the suction hose of the sump pump in the dipstick hole. Push down the pump handle quickly and pull it up slowly.

Remove the sump pump when all the old oil has been pumped out.

Or, if sufficient space below the gearbox is available, oil can be drained by removing the drain plug.

Collect the oil in a dripping pan.

28 Changing the oil filter

The filter element must be replaced at the same time as the oil.

Turn the screw that holds on the filter cover to the left and remove the filter from its housing. Use an Allen key for this.
4 Maintenance

Withdraw the filter element (1).

Check the O-rings (2 and 3) for damage and replace if necessary.

Install the new filter and mount the unit on the gearbox.

28 Filling with new oil

Refill the gearbox to the correct level via the dipstick opening.
For oil specification see page 65.

In case your engine is equipped with another brand of gearbox follow the instructions given in the supplied owners manual for changing oil and other care and maintenance.

Changing the gearbox oil (ZF-Hurth)
Every 500 operating hours.
4 Maintenance

30 Checking / adjusting valve clearance
Checking the valve clearance must be done with a cold engine, that is an engine which did not run for at least 6 hours.

31 Remove rocker cover
Remove the 5 bolts of the rocker cover. Complete the following steps:

32 Locating TDC
Locate the Top Dead Center (TDC), at the end of the compression stroke, for cylinder 1 by barring the engine slowly until the TDC marks of the engine block and the crank pulley match.

Note: There are two TDC’s e.g. compression and suction. At the TDC at the end of the compression stroke the rocker arm does not move when the crank pulley is rotated a little.
4 Maintenance

32 Adjusting valve clearance

- Check valve clearance at cylinder 1 and adjust if necessary.
- Rotate the crankshaft 180° clockwise and check valve clearance at cylinder 3.
- Again rotate the crankshaft 180° and check valve clearance at cylinder 4.
- Finally again rotate the crankshaft 180° and check valve clearance at cylinder 2.

34 Cylinder numbering

Cylinders are numbered consecutively, beginning at the front end.
35 Fuel filter removal

The fuel filter is to be replaced as a unit.
- Close the fuel stopcock.
- Remove the fuel filter, use a filter wrench. Catch any fuel.

⚠️ DANGER
Keep naked flames away when working on the fuel system. Do not smoke!

36 Fuel filter installation

- Clean any debris from the filter carrier rim.
- Lubricate the rubber gasket sparingly with clean engine oil.
- Fill the new filter with clean diesel fuel.
- Install the filter. When the rubber gasket touches the housing, apply another tightening of a half to three quarters of a turn by hand.
- Open fuel stopcock.
- Check for leaks.

Fuel filter replacement

Every 500 operating hours.
4 Maintenance

37 Fuel lift pump

- Check, and if necessary clean, filter inside the fuel lift pump.
- Open the fuel stop cock.
- Check for leakage.

38 Bleeding

After replacing the fuel filter and cleaning the pilot filter inside the fuel lift pump the air has to be bled from the fuel system.

For bleeding see page 36.

Start the engine

Operate the starter switch until the engine fires; release the starter switch if the engine does not fire within 20 seconds. Wait until the starter motor has stopped before making a new attempt to start the engine.

Repeat the above if the engine cuts out after a short time.

Cleaning fuel lift pump

Every 500 operating hours.
4 Maintenance

39 Inspection V-belt

Inspect the belt for wear and tear (fraying and cracking). Belts which are in poor condition should be replaced.

Check, tension and change belts only with the engine off. Refit belt guard, if provided.

40 Checking tension

Check tension of the V-belt by applying moderate finger and thumb pressure. If the deflection of the belt is more than 12 mm (1/2"), using about 10 kg (20 lbs) thumb pressure, it should be tensioned.

41 Tensioning V-belt

Loosen the bolt of the adjustment bracket and both the alternator mounting bolts. Now push the alternator outwards until the belt tension is correct.

Now first re-tighten the upper mounting bolt of the alternator. Then re-tighten the bolt of the adjustment bracket and the lower mounting bolt.
42 Check flexible engine mounts

Check the bolts which secure the damper element, the mounting bolts to engine bed and the nuts at the adjustment spindle for tightness. Inspect the rubber element of the engine support for cracks. Also check the deflection of the damper element, the deflection influences the alignment of engine and propshaft! Re-align engine in case of doubt.

43 Inspection hose connections

Inspect all hose connections of the cooling system. (Cracked hoses, loose hose clamps)

44 Check fasteners

Check tightness of all fasteners, bolts and nuts.
4  Maintenance

45 Raw water pump inspection

The rubber impeller of the outboard water pump is not proof against running dry. If the water supply has been blocked, it may be necessary to replace the impeller. Always carry a spare impeller on board.

46 Pump cover removal

Inspection where appropriate changing is as follows:

- Close the sea cock.
- Remove the cover of the pump by unscrewing the screws out of the housing.

47 Impeller removal

- Slide the impeller off of the shaft using a waterpump plier.
- Mark the impeller to ensure correct re-installation if it is to be re-used. The impeller must be installed in the same position as removed.

Only engines with intercooling!
48 Impeller inspection

- Inspect the impeller for damage.
- Replace the impeller if necessary.

⚠️ NOTE

Only engines with intercooling!

49 Re-install the impeller

- The impeller should be lubricated with glycerin or a non-petroleum based lubricant such as a silicone spray before fitting it into the impeller housing.
- Fit the impeller to the pump shaft. (If an existing impeller is re-used, install it in the same position as removed).

50 Replacing the pump cover

- Replace the cover with a new O-ring.
- Check the water filter and open the sea cock.
4 Maintenance

51 Coolant replacement

The coolant has to be replaced every 1000 operating hours or at least once every two years.

N.B. Replacing the coolant may also be necessary as part of the winter storage procedure; in case that the coolant present in the cooling system offers insufficient protection for the winter.

⚠️ DANGER

Be aware of the risk of skin burning during draining the hot coolant! Used coolant must be collected in a container for proper disposal according to laws and regulations.

⚠️ WARNING

Cooling system protective liquids must be disposed of in accordance with environmental regulations.
4 Maintenance

Coolant replacement
Every 1000 operating hours.

52 Draining of coolant

Detach the hose to the oil cooler (1) and remove the drainplug from the heat exchanger (2).

Remove the filler cap to vent the cooling system and check that all the coolant has been drained.

After draining replace the drain plug.

**Keel cooler**
How the cooling system in engines with keel cooling should be drained depends on the installation of the keel cooler. Refer to the keel cooler manufacturer's instructions for this.

Check using a coolant hydrometer whether the coolant is providing sufficient protection against freezing if total draining off is not possible.
56 Filling the cooling system

Remove the cap of the filler neck on the top of the heat exchanger housing. Remove the bolt from the upper side of the thermostat cover, so that air can escape from the cooling system. Fill the cooling system. Use a mixture of 40% antifreeze (ethylene-glycol based) and 60% tap water or use a special coolant.

For specifications see page 87.

The level of the coolant must be approx. 1 cm (3/8") below the lower edge of the filler neck. Bleeding will take place automatically during filling! Replace the filler cap.

After the engine has run for the first time and has reached operating temperature and has cooled down again to ambient temperature, check the coolant level in the heat exchanger housing. If necessary, add coolant.

⚠️ CAUTION

Never fill the cooling system with sea water or brackish water.
54 Filling coolant system if a water heater is connected

A) The highest point of the water heater is situated at a lower level than the expansion tank for the ship’s engine. The water heater will be **filled and bled automatically** during filling of the cooling system.

B) The highest point of the water heater is situated at a higher level than the expansion tank for the ship’s engine. The water heater will **not** be filled and bled automatically during filling of the cooling system.

**Note:**

Fill the cooling system via the extra expansion tank. Open the valve during the filling and bleeding of the system. Close the valve again once the system is filled.
4 Maintenance

Changing the air filter, checking the starter motor and alternator

Every 1000 operating hours.

55 Changing the air filter

- Loosen the hose clamp (1).
- Remove the filter housing (2).
- Remove the old filter and fit a new filter (3).
- Replace the unit in reverse order and tighten the hose clamp again.

56 Checking the starter motor

Check for visible defects.
Check whether the Bendix engages with the starter ring when the starter motor is activated. If the Bendix does not engage properly, contact your Vetus dealer.

57 Checking the alternator

Check for visible defects.
Remove the alternator belt. Turn the pulley by hand to check whether the alternator can be turned easily. If this is not the case, contact your Vetus dealer.

⚠️ WARNING

Never clean the element with petrol or hot liquids.
At full load (with the boat cruising) the maximum engine speed should be about 3000 RPM (see technical data page 80). If the engine does not reach this speed, it is being overloaded!

If this is the case, check the ship’s propeller for defects or irregularities, and also to see that it is the correct pitch and diameter.

The engine idling speed should be 900 rpm. Allow the engine to warm up normally (until the coolant temperature reaches at least 60°C (140°F)) before checking and/or adjusting the idling speed. Check the engine RPM using a rev. counter, or use the rev. counter fitted to the control panel.

If the engine speed differs from that stated above, it must be adjusted. The engine idling speed can be reset using the adjustment screw on the fuel pump.
4 Maintenance

⚠️ NOTE

Only engines with intercooling!

Only clean the heat exchanger if this is (badly) fouled.

Under normal conditions of use cleaning the heat exchanger is not necessary!

The engine temperature will be higher than normal if the heat exchanger is fouled.

Possible causes of fouling are:
- Small rubber particles from a damaged sea water pump impeller.
- Growth of algae or seaweed.

• Close the seacock and detach the water inlet hose from the sea water pump.

• Drain the coolant: To do this, remove the drain plug from the heat exchanger housing.

Cleaning the heat exchanger

60 Remove the drain plug
4 Maintenance

Remove the filler cap from the top of the heat exchanger housing to allow air into the system and check that all coolant has drained off.

Cleaning the heat exchanger

61 Removal of bolts out of the end covers

Take out both central bolts from the end covers and take the end covers with the O-rings out of the housing.

NOTE

Only engines with intercooling!
4 Maintenance

62 Revolving the alternator outwards
Loosen the bolts of the adjustment bracket and both the alternator mounting bolts.
Remove the belt.
Push the alternator outwards to have enough room to slide the heat exchanger out of the housing.

63 Remove heat exchanger
Slide the heat exchanger out of the housing.

64 Cleaning the heat exchanger
Clean the heat exchanger: Use a pipe cleaner to remove fouling in the pipes.
Then rinse the heat exchanger pipes with clean water.
Ensure that both heat exchanger end chambers are free from dirt.

Note
Only engines with intercooling!
4 Maintenance

65 Replacing heat exchanger

Replace the heat exchanger in the original position in the heat exchanger housing. Use new O-rings (61 x 2.5 mm) which have been greased.

66 Replacing the end covers

Fit the end covers in the housing; the connector cover is fitted with a locating pin so that it can be fitted in one way only in relation to the heat exchanger. This ensures the correct position of the separator baffle in the connector cover in relation to the heat exchanger.

Tighten up the bolts when both covers are in the correct position.

- Refit the drain plug.
- Reconnect all hoses previously removed.
- Refill the cooling system, see page 56.

Cleaning the heat exchanger

Only engines with intercooling!
5 Winter storage procedure

1 Fuel system

Drain the water from the water separator/fuel filter and the fuel tank. Ensure that the tank is completely filled with fuel.

Running with protective fuel mixture
Connect the fuel supply pipe to a can filled with a mixture of one (1) part of engine oil* to nine (9) parts of clean fuel**. Use this mixture to run the engine at no load for approx. 10 minutes.
Stop the engine.

* Engine oil with protective properties. E.g.:
Vetus Marine Diesel Engine Oil 15 W-40
Shell Nautilus Premium Inboard 15W-40

** Preferably water-free fuel.
Collect some fuel from the return pipe, while engine is running.

CAUTION

Never run the engine under load with this mixture of fuel and oil.
5 Winter storage procedure

2 Lubrication system

With the engine still at operating temperature: (If not, run the engine until warm, then turn off.)

Replace the oil filter and change the engine oil; use oil with protective properties. See page 65.

3 Raw water cooling system

Close the seacock before removing the lid of the water strainer. If necessary, clean the raw water strainer.

Pour 1 litre (1/4 Imp.gal.) of anti-freeze into the water strainer and run the engine until the anti-freeze has disappeared into the cooling system.

Take care that no anti-freeze is spilled into the waterway (anti-freeze is poisonous).

Check the seal between the lid and housing after cleaning and re-assembling the strainer.

An improperly sealed lid will result in air sucked in by the raw water pump which again will result in overheating of the engine.

⚠️ NOTE

Only engines with intercooling!
4 Fresh water cooling system

To avoid corrosion during winter storage the cooling system must be filled with an antifreeze/water mixture (or a coolant). For specifications see page 87.
N.B. Replacing the coolant is only necessary if the coolant present in the cooling system offers insufficient protection for the winter.
For coolant replacement see page 54.

5 Electrical system

Disconnect the battery cables.
Charge batteries during winter lay-up regularly if required!
6 Recommissioning after winter storage

1 Fuel system

Drain the water from the water separator/fuel filter. (page 35)

Drain the water from the fuel tank.

Install a new fuel filter. (page 48)
2 Lubrication system
Check the engine oil level. (page 32)

3 Raw water cooling system
Check that the lid of the raw water strainer is reinstalled.

⚠️ NOTE
Only engines with intercooling!
6 recommissioning after winter storage

The lid of the raw water pump and drain plugs are reinstalled. (pages 52, 53)

Re-tighten possible loose hose clamps.

Open the sea cock.

⚠️ **Note**

Only engines with intercooling!

⚠️ **Note**

Only engines with intercooling!
6 Recommissioning after winter storage

4 Fresh water cooling system
Check the coolant level. (page 38)

5 Electrical system
Make sure that the batteries are fully charged. (page 40, 66)
Connect the batteries.
6 Recommissioning after winter storage

6 Check engine for leaks
Start the engine.
Check the fuel system, the cooling system and the exhaust for leakage.

7 Changing the gearbox oil
Stop the engine and change the oil of the gearbox. (page 43 and 44)

8 Checking instruments and remote controls
Check the operation of the instruments, the remote control and the gearbox.
Engine faults are in most cases caused by improper operation or insufficient maintenance.

In case of a fault, always check first that the operation and maintenance instructions have been followed.

In the following tables information is given about the possible causes of faults and suggested remedies.

Please note that these tables can never be complete.

If you are unable to identify the cause of the fault or to rectify it yourself, then contact the nearest service representative.

Before starting, make sure that nobody is in the immediate vicinity of the engine. When carrying out repair, **never** start the engine with the fuel injection pump removed removed.

**Disconnect battery!**
# 7 Troubleshooting

## 1 Engine will not crank

<table>

### Technical data

**Model**

<table>
<thead>
<tr>
<th>M4.55</th>
</tr>
</thead>
</table>

**General**

- **Make**: Vetus Mitsubishi
- **Number of cylinders**: 4
- **Based on**: S4L2-T
- **Type**: 4-stroke diesel, in-line
- **Injection**: Indirect
- **Aspiration**: Turbo-charged
- **Bore**: 78 mm
- **Stroke**: 92 mm
- **Total displacement**: 1758 cm³ (107 cu.inch)
- **Compression ratio**: 22 : 1
- **Idling speed**: 900 rpm
- **Max. no. of revolutions at no load**: 3350 rpm
- **Valve Clearances (cold)**: Inlet 0.25 mm (0.010”), Exhaust 0.25 mm (0.010”)
- **Weight (with standard gearbox)**: 192 kg (423 lbs)

**Engine installation**

- **Max. installation angle**: 15 degrees backwards
- **Max. athwartships angle**: 25 degrees continuously, 30 degrees intermittent

**Maximum Output**

- at the flywheel (ISO 3046-1): 38.3 kW (52 hp)
- at the prop shaft (ISO 3046-1): 37.1 kW (50.4 hp)
- at no. of revolutions of Torque, at no. of revolutions: 3000 rpm
- : 127 Nm (13 kgm, 93.7 ft.lb)

**Fuel consumption**

- at no. of revolutions: 1800 rpm

**Fuel System (Self-bleeding)**

- **Injection pump**: Bosch model M (Nippon Denso)
- **Injectors**: Plug injector
- **Opening pressure**: 140 bar (kgf/cm³) (2030 psi)
- **Firing order**: 1- 3 - 4 - 2
- **Injection timing**: 14° BTDC
- **Fuel filter element**: STM3690
- **Fuel lift pump**:
- **Suction height max.**: max. 1.5 m (5 ft)
- **Fuel supply connection**: for hose 8 mm (5/16”) I.D.
- **Fuel return connection**: for hose 8 mm (5/16”) I.D.

</tbody>
</table>
Fuel Quality Grade

Use commercially available diesel fuel with less than 0.5% sulfur content. If the sulfur content is higher than 0.5%, the intervals between oil changes should be halved e.g. change oil every 250 hours. Don’t use fuel with more than 1% sulfur!

The following fuel specifications / standards are approved:
• CEN EN 590 or DIN/EN 590 (under development)
• DIN 51 601 (Feb. 1986)
• BS 2869 (1988): A1 and A2
• ASTM D975-88: D1 and D2
• NATO Code F-54 and F75

The exhaust emission levels determined during certification by the supervising authority are always based on the reference fuel described by law.

Winter-grade fuel

Waxing may occur at low temperatures, clogging the fuel system and reducing engine efficiency.

If the ambient temperature is less than 0°C (+32°F), winter-grade fuel -suitable down to -15°C (+5°F) - should be used. This fuel is usually available from filling stations well in advance of the cold months. Diesel fuel containing additives (Super Diesel) is often on sale as well, for use down to -20°C (-4°F).

Biodiesel

⚠️ Caution

Only use the prescribed diesel fuel.

Do not use biodiesel!
9 Operating media

Engine oil

Lubricating oils are specified by performance and quality classes. It is usual for the specifications to be indicated according to the API (American Petroleum Institute).

Acceptable API oils: CF, CF-4, CI-4

Only use oil of a recognised brand to lubricate the engine. The choice of a correct oil guarantees that the engine starts easily, because an oil film remains on the cylinder walls and bearing surfaces. The friction is low and so the starting rpm necessary for a dependable start can be achieved with a lower starting torque. An incorrect choice of oil can lead to a thickened oil layer on the cylinder walls and bearing surfaces. This can in turn lead to higher frictional resistance and more effort, which forms a hindrance to reaching the starting rpm required for a dependable start, and this results in a reduced lifespan.

Recommended lubricating oil viscosity

There are two important considerations when it comes to ambient temperature in order to achieve satisfactory engine performance.

- the possibility to turn the engine over quickly enough to make an easy start possible and
- adequate lubrication of internal wear surfaces during starting and warming up.

By making the right choice of lubricating oil these requirements can be met. The recommended oil viscosity is shown in the overview below:

Because the viscosity (runniness) of lubricating oil varies with temperature, the ambient temperature in which the engine is started determines the choice of viscosity class (SAE class).

To avoid having to change the oil for different seasons we recommend SAE 15W-40 all-season motor oil.

For example:

- Vetus Marine Diesel Engine Oil 15 W-40
- Shell Nautilus Premium Inboard 15W-40

For oil capacity see p. 81.
9 Operating media

⚠️ CAUTION

Do not mix oil of different brands together. Oils of different brands are mostly not compatible with each other. If they are mixed, the mixtures can cause components such as piston rings, cylinders etc. to seize up and cause wear to moving parts. The best thing is to keep to one brand and one type of lubricating oil for each subsequent service.

Limits concerning motor oil

If an analysis of the used lubricating oil is conducted to determine its condition, consult the overview below. Change the oil if one or more of the conditions is not met.

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Unit</th>
<th>Test method</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Viscosity</td>

<td>0.5 max.</td>
</tr>
<tr>
<td>Coagulated pentane insolubles</td>
<td>% weight</td>
<td></td>
<td>3.0 max.</td>
</tr>
</tbody>
</table>

⚠️ NOTE

- How often the oil has to be changed depends on the characteristics of the fuel. Only use the recommended fuels.
- The limit for the total base number is half of that of new oil in the case of an analysis method based on perchloric acid.

Lubricating oil

•

•
9 Operating media

Gearbox Lubricating Oil

Only use a recognised brand of oil for lubricating the gearbox.

Technodrive:
- type TM345 : 1.6 litres, Motorolie SAE 20W40-CD (2.8 UK pt, 3.4 US pt)
- type TM345A : 1.6 litres, Motorolie SAE 20W40-CD (2.8 UK pt, 3.4 US pt)
- type TMC60 : 0.8 litres, Motorolie SAE 20/30 (1.4 UK pt, 1.7 US pt)
- type TMC60E : 0.8 litres ATF*)
- type TMC60M : 0.8 litres ATF*)

ZF Hurth:
- type ZF25 : 2.5 litres ATF*) (4.4 UK pt, 5.3 US pt)
- type ZF25A : 1.8 litres ATF*) (3.2 UK pt, 3.8 US pt)

*) ATF : Automatic Transmission Fluid; Transmissie olie type A, Suffix A.

For example :
- Vetus Marine Gearbox Oil
- Shell Donax T6
- Gulf Dextron

Other brands of gearboxes:
See supplied owners manual for oil type and quantities.
9 Operating media

Coolant fluid

The preparation and monitoring of coolant in inter-cooled engines is especially important because corrosion, cavitation and freezing can lead to engine damage. Use as coolant a mixture of a cooling system protective liquid (anti-freeze, ethylene glycol based) and tap water.

In tropical climates, where anti-freeze availability may be limited, use a corrosion inhibitor to protect the engine cooling system.

The concentration of the cooling system protective liquid in the coolant should not fall below/exceed the following limits:

<table>
<thead>
<tr>
<th>Cooling system protective liquid (Anti-freeze)</th>
<th>Water</th>
<th>Protection against freezing to</th>
</tr>
</thead>
<tbody>
<tr>
<td>max. 45 vol%</td>
<td>55%</td>
<td>-35°C (-31°F)</td>
</tr>
<tr>
<td>40 vol%</td>
<td>60%</td>
<td>-28°C (-18°F)</td>
</tr>
<tr>
<td>min. 35 vol%</td>
<td>65%</td>
<td>-22°C (-8°F)</td>
</tr>
</tbody>
</table>

The protective liquid concentration must be maintained under all circumstances. Therefore if coolant must be added always use the same mixture of anti-freeze and tap water.

Water quality for coolant preparation

Use preferably tap water.

If an other available fresh water is used; the values given below must not be exceeded.

<table>
<thead>
<tr>
<th>Water quality</th>
<th>min.</th>
<th>max.</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH-value at 20°C (68°F)</td>
<td>6.5</td>
<td>8.5</td>
</tr>
<tr>

</tr>
<tr>
<td>Sulfate ion content</td>
<td>–</td>
<td>100</td>
</tr>
<tr>
<td>Total hardness</td>
<td>3</td>
<td>12</td>
</tr>
</tbody>
</table>

⚠️ CAUTION

Never use sea-water or brackish water.

⚠️ WARNING

Cooling system protective liquids must be disposed of in accordance with environmental regulations.
